

# Cloud IBR Recovery Report

**Prepared for:** Cloud IBR Demo

**Recovery Test Date:** 02/06/2025 21:17:15

**Background:** Cloud IBR provides a simple, cost-effective, fully automated Backup Recovery as a Service (BRaaS) platform for your Veeam backups, with on-demand, automation-driven Bare Metal Cloud (BMC) servers, storage and network infrastructure. The following is an explanation of your Recovery Report.

**Recovery Overview:** Displays information on the settings chosen for the recovery, how many servers were successfully recovered, failed or skipped, when the recovery started and ended, the duration of the recovery which is your Recovery Time Objective (RTO), which Veeam Repositories were included in the recovery and which Cloud Provider your servers were recovered to.

**Recovery Sessions:** Displays all servers that were included in the recovery, their internal IP address, the date of the Veeam Restore Point, the IP address of the ESXi host that it was restored to and whether the restore was successful or not.

**Recovery Credentials:** All OpenVPN user credentials, details of the physical hosts provisioned in the BMC and the IBR Firewall that hosts OpenVPN server and IPSEC Tunnels. During a Manual Shutdown test, IT managers can RDP to the Veeam server and connect to the ESXi console via https from any IP addresses you added to the BMC Remote Access tab.

**Recovery Network Information:** IP block assigned to the BMC infrastructure and External/Internal IP's for each Port Mapping configured on the IBR Firewall. In an actual disaster failover, update your public DNS records to point to their new External IP addresses.

**Skipped Servers:** Pay close attention to the reasons provided for skipped servers to ensure that these were skipped by design. By default, your most recent backups from within the last 7 days are restored, to prevent restoring old backups of decommissioned servers. However, if you have not successfully backed up your production servers within the last 7 days, they will also be skipped.

**Troubleshooting:** For failed server restores, run a [Health Check](#) within Veeam for the backup or backup copy job to ensure the backup is in a healthy state. Running an Active Full backup will usually resolve these errors.

# Recovery Overview

Status **teardown\_complete**

Session Summary

**Success: 5**

**Skipped: 1**

**Failed: 0**

---

**Port:** 443  
**Internal IP:** 10.10.5.101  
**External IP:** 131.153.240.124

## Skipped Servers

**i** List of servers skipped due to their recovery point being older than the number of days you selected to restore from (default is within 7 days) or due to backup type incompatibility with the latest version of Veeam REST API calls. Please open a ticket with Veeam to request support of any skipped backup types.

## AgentBasedDemo

Skipped

Percent Complete - 0

---

**IP Address:**

**GuestTools Running:** No

**Restore Point Date:** 2024-02-13 03:02:31 - 11 months before recovery started

**VMWare Tools Install Status:**

**Result:**

**Platform:** EndPoint

### Notes

Skipped because the most recent backup in your backup repository is older than the requested threshold of 7 days.
